Why companies fail to automate regression testing Isard Haasakker

Large multinational companies can have very complex IT systems supporting sales, procurement and manufacturing processes on a worldwide scale. Regression testing has as primary objective to avoid system downtime when new or enhanced functionality is introduced to support these critical business processes. Many companies struggle to execute proper regression test cycles because there is a conflict between a) the wide range of critical business processes that must be taken into account and b) the short time period available for testing.

When all the tasks associated to regression testing are executed manually, then you require a lot of human resources to prepare all the data before you can validate the test results. This is especially frustrating because you expect to conclude that the system behaves as expected. Therefore you spend a lot of effort to conclude that there are no issues.

It makes a lot of common sense to automate regression testing as much as possible. But when you want to spend a lot of effort to automate regression testing, then you need a methodology that allows a reasonable expectation for success. This methodology needs to be defined and agreed by everyone involved before a tool is selected for regression test automation.

This document will assist you in defining a methodology to implement automated regression testing successfully. This methodology is unique and requires ten steps to persuade the entire company to embrace the necessary change management consequences within the business.

The primary aim for this document is to allow senior managers at multinational companies to find a strategy to achieve a considerable cost saving on their IT budgets without compromising on quality.
